

A graph 'g' is said to be tree if it is connected and has no cycles in it.

Eg:

The tree has to be simple graph because loops & parallel edges form cycles. The tree possesses at least 2 pendant vertices of a tree is called leaf.

A graph which is the tree is usually denoted by P.

Each connected component of a tree is called as forest.

Theorem 1 - In a tree there is only 1 path b/w every pair of vertices.

proof: Let T be a tree. Then T is a simple connected graph. Since T is connected there must be atleast 1 path b/w every 2 vertices. If there are 2 paths b/w a pair of vertices of T, the union of the paths will become an cycle & T cannot be a tree. Thus b/w every pair of vertices in a tree there must exist one & only one path.

Theorem 2 - In a graph 'y' there is only 1 path b/w every pair of vertices, then y is a tree.

proof - Since there is a path b/w every pair of vertices in 'y' it is obvious that 'y' is connected. Since there is only 1 path b/w every pair of vertices, y cannot have a cycle. Because if there is a cycle then there will be two path b/w 2 vertices on the cycle. thus y is connected graph containing no cycle.

This means y is a tree.

Theorem - A tree with  $n$  vertices has  $n-1$  edges.

Proof - We prove the theorem by induction on  $n$ .

The theorem is obvious for  $n=1, n=2, n=3$

Assume that the theorem holds for all trees with ' $k$ ' vertices where  $k \leq n$ , for a specified  $\forall$  integer  $k$ . Consider a tree  $t$  with  $k+1$  vertices. In this 't' let 'e' be an edge with ' $n$ ' vertices  $u \neq v$ . Since 't' is a tree, it has no cycles & therefore there exist no other edge or path b/w  $u$  &  $v$ . Hence deletion of 'e' from 't' will disconnect the graph  $t-e$  consist of exactly 2 components say  $t_1, t_2$ . Since  $t$  doesn't contain any cycle, the components  $t_1, t_2$  also not contain any cycle. Hence  $t_1, t_2$  are trees on their own. Both of this tree have less than  $k+1$  vertices each & therefore by assumption the theorem holds for  $t_1, t_2$  therefore, the total no. of vertices  $|t_1| + |t_2|$  are taken together is  $k+1$ , the total no. of edges in  $t_1, t_2$  taken together is  $(k+1) - 2 = k-1$ . But  $t_1, t_2$  taken together is  $t-e$ . Thus  $t-e$  contains  $k-1$  edges. Consequently  $t$  has exactly  $k$  edges.

Thus, the theorem is true for  $k+1$  vertices. Hence by induction the theorem is true for all the integers  $n$ .

Directed tree - Let 'D' be a directed graph & 'G' be its underlying graph. We say that 'D' is a directed tree whenever 'G' is a tree.

Thus directed tree is a directed graph whose underlying graph is a tree.

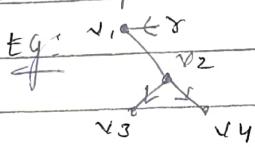

A directed tree 'T' is called a rooted tree if i) T contains the unique vertex, called the root whose indegree = 0.

ii) The indegree of all other vertices of T are equal to 1.

In a rooted tree, we denote the root by 'r' & draw the diagram of the tree downward from an upper level to lower level, so that the arrows can be dropped.

A vertex of a rooted tree is said to be at the kth level or has level  $\underline{m} \leq k \leq n$  if the path from r to V is of length k.

$v_1 \rightarrow$  1st level - parent

$v_2 \rightarrow$  2nd level - child

$v_3, v_4 \rightarrow$  3rd level

In a rooted tree a vertex whose outdegree is 0 is called a leaf & a vertex which is not a leaf is called an internal vertex.

m-ary tree - A rooted tree 'T' is called an m-ary tree if every internal vertex of T is of outdegree  $\leq m$ , i.e. if every internal vertex of T has at most m children.

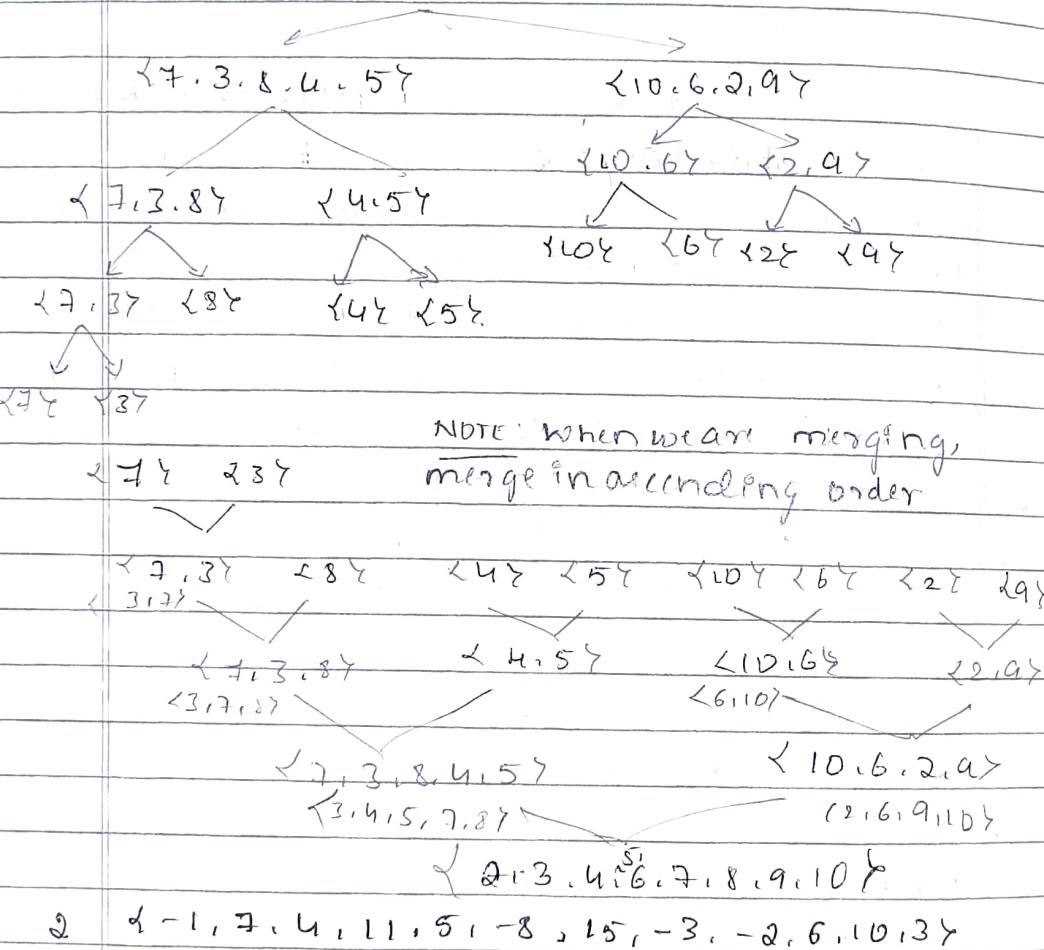

A rooted tree 'T' is called a complete m-ary tree if every internal vertex of T is of outdegree m, i.e. every internal vertex of T has exactly m children.

Binary tree - An m-ary tree for which  $m$  is equal to 2 is called a binary tree.

In other words the rooted tree + is called a B.T. If every vertex of + is of outdegree  $\leq 2$ , i.e., every vertex has atmost  $m$  children.

1. Using the mergesort method. sort the list {7, 3, 8, 4, 5, 10, 6, 2, 9}

Binary sequence - A sequence consisting of only 0's and 1's is called a binary sequence or binary string.

Eg: 01, 001, 1101

The no. of elements contained in a sequence is called its length. Thus, Eg: 2, 3, 4 for 01, 001, 1101.

prefix code - Let 'P' be a set of binary sequences that represent a set of symbols. Then 'P' is called a prefix code, if no sequence in P is the prefix of any other sequence in P.

Eg:  $P_1 = \{10, 0, 1101, 111, 1100\}$

$P_2 = \{01, 0, 101, 10, 1\} \rightarrow$  This is not a prefix code.  
because 10 is repeating. i.e., 10 & 101.

1. Consider the prefix code  $A = 111, B = 0,$   
 $C = 100, D = 1101, E = 10$  using this code.

decode the following sequence.

i) 100111101 - e b a d.

ii) 10111100110001101 - e a e b c b d

iii) 1101111110010 - d a c e.

Soln: The given seq. is -

keeping the given code we split the given sequence into appropriate no. of parts so that sequence can be decoded.

2. A code for a, b, c, d, e, f is given by  $a = 00,$   
 $b = 01 \Rightarrow c = 101, d = 110 \Rightarrow e = yz1$  where  $x, y, z \in \{0, 1\}$ . Determine  $x, y, z$  so that the given code is a prefix code.

Soln: If we set  $x = 0$ , then the code for d is 010 which contains the code 01 of b. which is a prefix code already.  $\therefore$  we cannot take  $x = 0$ .

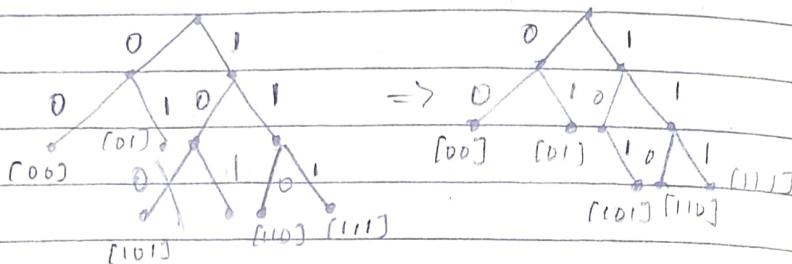

This implies  $x = 1$ , & then d is 110. checking,  
for e. i) taking  $y = 0$  &  $z = 0$  then, e has the code 001 which contains the code 00 of a i.e.,

a: 00 which is prefix. this implies it's not a prefix code.

contd. write ii) & iii) & iv)

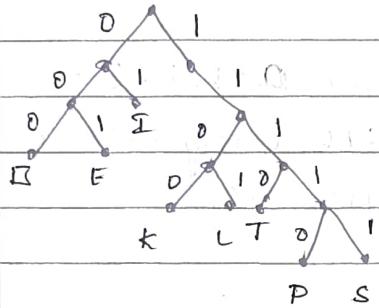

∴ the value of  $a=1 \cdot y=1 \& z=1$

3. Construct the binary tree that represent the prefix code  $P = \{000, 001, 101, 110, 111\}$ .

- 4 Obtain a prefix code for the letters B, E, I, K, L, T, P, S. If the coding scheme  $P_c$  given by.

iii) The code for BEST: 000001 11111 1110

iv) PIPE: 11110 01 1110 001

v) SPLIT

Weighted trees - Consider a set of ' $n$ ' +ve integers  $w_1, w_2, w_3, \dots, w_n$  where  $w_1 \leq w_2 \leq w_3 \leq \dots \leq w_n$ . Suppose we assign these integers to the ' $n$ ' leaves of a complete B-T in any 1-1 manner.

The resulting tree is called complete weighted B-T with  $w_1, w_2, \dots, w_n$  weight. If  $l(w_i)$  then  $W(T) = \sum_{i=1}^n w_i l(w_i)$ . If  $W(T)$

then  $W(T) = \sum_{i=1}^n w_i l(w_i)$ . If  $W(T)$  is assigned

$\rightarrow$  ( $i$  is the level no. of the leaf  $T$  which has the weight  $w_i$ ) is assigned

$$W(T) = (2 \times 7) + (2 \times 3) + (1 \times 4) = 14 + 6 + 4 = \underline{\underline{24}}$$

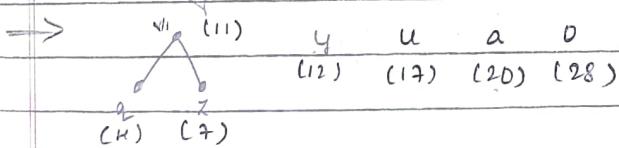

Optimal Tree - Given a set of weights, suppose we consider a set of all complete B-T to whose leaves, these weights are assigned. Here a tree in this set which carries the minimum weight is called an optimal tree for the weights.

Optimal Prefix Code - All the vertices & the leaves of the tree can be identified by binary sequence. The binary sequence through which the leaf are identified yield a prefix code for the symbol representing that leave. This prefix code is known as optimal prefix code.

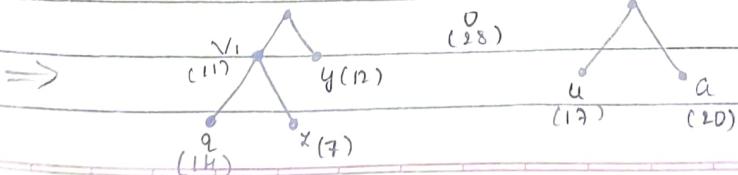

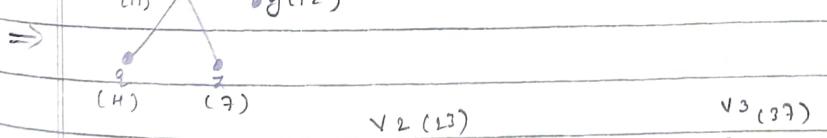

~~Construct a optimal prefix code for the symbols a, o, q, u, y, z that occur with frequencies 20, 28, 4, 17, 12, 7.~~

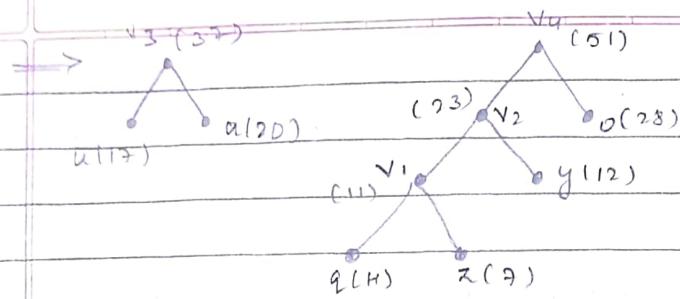

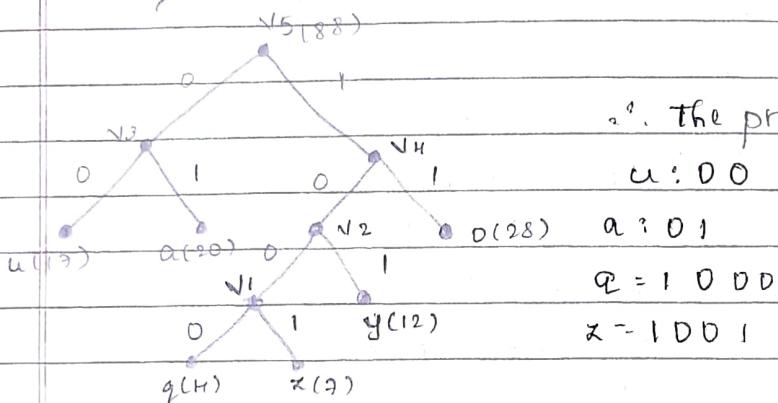

First arrange the give frequency in ascending order.

|     |     |      |      |      |      |
|-----|-----|------|------|------|------|
| q   | x   | y    | u    | a    | o    |
| (4) | (7) | (12) | (17) | (20) | (28) |

|      |      |      |         |        |
|------|------|------|---------|--------|
| u    | a    | v1   | v2 (23) | o (28) |
| (17) | (20) | (11) |         |        |

 $\Rightarrow$ 

∴ The prefix codes are

$$u: 0 \quad y: 101$$

$$a: 01 \quad 0: 11$$

$$v = 1000$$

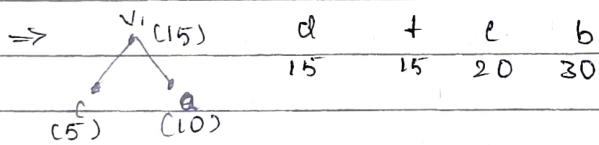

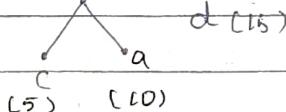

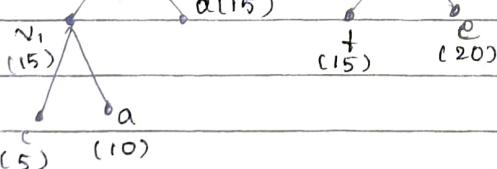

$$z = 1001$$

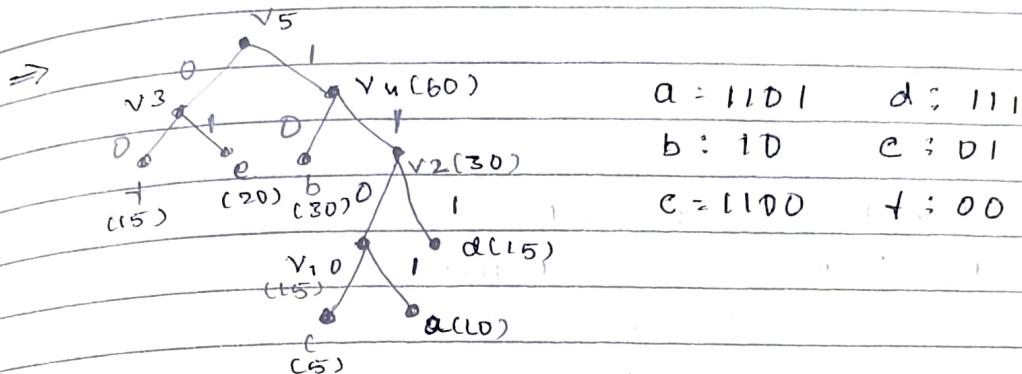

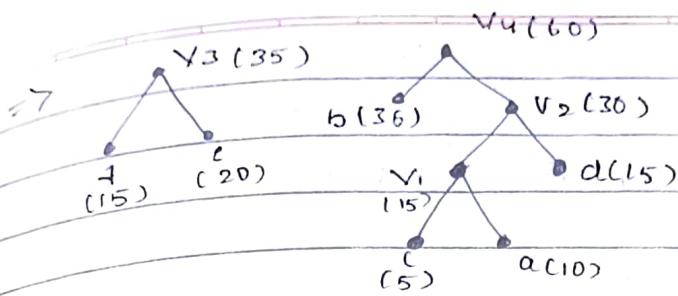

d) a b c d e +

## ENGINEERING.

Theorem - Any connected graph with ' $n$ ' vertices &  $n-1$  edges is a tree.

Proof - Let ' $g$ ' be a connected graph with ' $n$ ' vertices &  $n-1$  edges. Assume that ' $g$ ' is not a tree. Then ' $g$ ' contains a cycle say ' $c$ '. Let ' $E$ ' be an edge in ' $c$ '. The graph ' $g$ ' will not become disconnected if ' $E$ ' is deleted.

Thus ' $g-E$ ' is a connected graph. But on the other hand ' $g-E$ ' has ' $n$ ' vertices &  $n-2$  edges. Therefore it can be connected. This is a contradiction to  $g$ . Hence,  $g$  must not have a cycle. This means ' $g$ ' must be a tree.

Minimally connected graph - A connected graph is said to be minimally connected if the removal of any edge from it disconnects the graph.

Theorem - A connected graph is a tree if and only if it is minimally connected.

Proof - Suppose ' $g$ ' is a connected graph which is not a tree. Then ' $g$ ' contains a cycle ' $c$ '. The removal of any edge ' $E$ ' from this cycle will not make the graph disconnected. Therefore, the ' $g$ ' is not minimally connected. Thus, if a connected graph is not a tree then it is not minimally connected. This is equivalent to saying that if a connected graph is minimally connected then it is a tree.

Conversely, suppose ' $g$ ' is a connected graph which is not minimally connected. Then there exist an edge ' $E$ ' in ' $g$ ' such that  $g-E$  is connected. Therefore,  $E$  must lie in some

$g$  is not a tree means there will be cycles  
connected graph means there should be  $n-1$  edges

cycle in  $g$ . This implies that  $g$  is not a tree.  
Thus, if a connected graph  $g$  is not minimally  
connected then it is not a tree. This is  
equivalent to saying that if a connected  
graph is a tree then it is minimally connect-  
ed.

### M-01

planar graph - A planar graph is one that  
can be drawn in a plane without any edges  
crossing. Eg:

The diagram shows a complete bipartite graph  $K_{3,3}$  on the left, consisting of two sets of three vertices each, with every vertex in one set connected to every vertex in the other. Below it, a planar embedding of the same graph is shown on the right, where the vertices are arranged in two rows of three. Edges  $e_1, e_2, e_5, e_6$  form a pentagonal cycle around the bottom row. Edges  $e_3, e_4, e_7, e_8$  are internal to this cycle and do not cross any other edges. A note below says "This is not planar graph" with an arrow pointing to the original  $K_{3,3}$  drawing. Another note says "This is planar graph" with an arrow pointing to the embedding.

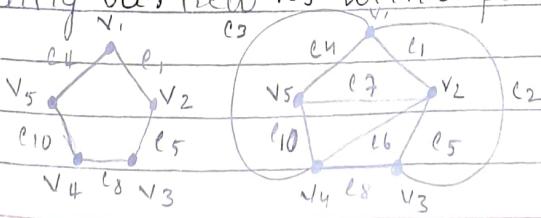

prove that complete graph  $K_5$  is a non-  
planar graph.

prop - The complete graph  $K_5$  there are 5  
vertices & 10 edges in it. The vertices are  
named as  $v_1, v_2, v_3, v_4, v_5$  & the edges are  
labelled as  $e_1, e_2, \dots, e_{10}$ .

The drawing of  $K_5$ , <sup>the</sup> 10 edges  $e_1, e_5, e_8, e_{10}, e_4$   
form an 'pentagonal cycle'. And the  
remaining 5 edges  $e_2, e_3, e_6, e_7, e_9$  are all  
inside this cycle & intersect at points other  
than the vertices.

Let us try to draw a diagram of  $K_5$  in which  
edges meet only at the vertices. Let us start  
drawing our new  $K_5$  with a pentagonal cycle.

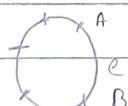

Consider the edge  $e_7 = \{v_2, v_5\}$  can be drawn inside or outside the pentagonal cycle.

Suppose we draw it inside as shown in fig, the other case follows similar. Now consider the edge  $e_2 = \{v_1, v_3\}$  &  $e_3 = \{v_1, v_4\}$ . If we draw these edges also inside the pentagon, there will intersect  $e_7$ . i.e., they cross  $e_7$  at point which are not vertices. Therefore, let us draw outside both of them outside the pentagon.

Consider, the edge  $e_6 = \{v_2, v_4\}$  we draw this edge outside the pentagon & intersect the edge  $e_2$ . Therefore, let us draw  $e_6$  inside the pentagon. Lastly, the edge  $e_8 = \{v_3, v_5\}$  draw outside the pentagon. It intersect the edge  $e_3$  & if we draw it inside & it intersect the edge  $e_6$ . This demonstrates, that in every possible plane drawing of  $K_5$ , at least 2 edges of  $K_5$  intersect at a point which is not a vertex of  $K_5$ , this proves that  $K_5$  is non-planar.

Theorem - P.T a connected graph 'g', remains connected after removing an edge 'E' from 'g' if & only if 'E' is a part of some cycle in 'g'.

Suppose 'E' is a part of some cycle in 'g'. Then the vertices of 'E' [say a & b] are joined by atleast 2 paths. 1 of which is E & the other is  $C-E$ .

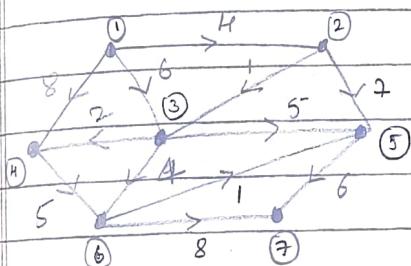

Hence the removal of 'E' from 'g' will not affect the connectivity of 'g' because

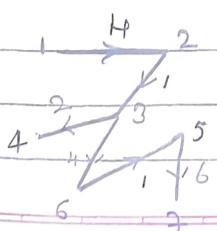

even after removal of 'E' -  
the end vertices of 'E' remain connected  
through the path

conversely, suppose 'E' is not a part of  
any cycle in 'G'. Then the end vertices of  
'E' are connected by utmost 1 part. Hence,  
the removal of 'E' from 'G' disconnects these  
end points. This means  $G - E$  is a disconne-  
cted graph. Thus if 'E' is not a part of any  
cycle in 'G' then  $G - E$  is disconnected. This  
is equivalent to saying that if  $G - E$  is  
connected then 'E' belongs to some cycle in  
 $G$ . Thus, the required result.

$\Rightarrow$  Dijkstra's Algorithm.

P.T A complete graph  $K_n$  with 'n' vertices contains  $n(n-1)/2$

Soln: A complete graph  $K_n$  is defined as a graph in which every pair of distinct vertices is connected by an unique edge.

A complete graph with 'n' vertices we want to count how many unique pairs of vertices can be formed. Each pair of vertices

corresponds to one edge. The no. of ways to choose 2 vertices from 'n' vertices is given by binomial co-efficient  $nC_2$ .

$$nC_2 = \frac{n!}{2!(n-2)!} = \frac{n(n-1)(n-2)!}{2(n-2)!} = \frac{n(n-1)}{2}$$

Spanning Trees - A spanning tree of a connected graph 'g' is a tree containing all the vertices of 'g'. A spanning tree of a graph 'g' is a maximal tree subgraph of that graph.
